

Table 3 Primary outcome availability and one-year vision

Footnote: negative logMAR change means improved vision. Primary secondary-comparison difference is combined minus ACXL, adjusted for baseline CDVA using CDVA12 ~ treatment + CDVA0. CIs use patient-cluster bootstrap where feasible; all cohort comparisons are observational and exploratory. A missing estimate is labelled not estimable with its reason.

Measure	TG-PRK + ACXL	ACXL alone	Comparison / explanation
Endpoint available / eligible eyes	[n/N (%)]	[n/N (%)]	Dated CDVA in the selected window.
Actual follow-up interval, days	[n; median(IQR)]	[n; median(IQR)]	Use dates, not column labels.
12-month CDVA, logMAR	[n; mean(SD); median(IQR)]	[n; mean(SD); median(IQR)]	[adjusted difference; 95% CI]
CDVA change, logMAR	[paired n; mean(SD)]	[paired n; mean(SD)]	Follow-up minus baseline.
12-month UDVA, logMAR	[n; mean(SD); median(IQR)]	[n; mean(SD); median(IQR)]	[exploratory difference; 95% CI]
UDVA change, logMAR	[paired n; mean(SD)]	[paired n; mean(SD)]	[difference in mean change; 95% CI]
