

Table 7 Final model transparency and missingness

Footnote: record final penalty/objective, scaling means/SDs and preprocessing with the model artefact. Ridge coefficients describe conditional predictive associations; no conventional unpenalized coefficient p-values or causal interpretation. Provide a supplementary missingness table for every variable, baseline/follow-up slot and cohort, and baseline characteristics of endpoint-observed versus endpoint-missing eyes.

Predictor	Unit / coding	Final coefficient	Resampling stability / missing n
Intercept	Original logMAR scale	[not run]	[bootstrap distribution]
Baseline CDVA	Per 1 logMAR	[not run]	[direction / distribution; missing n]
Age	Per 1 year	[not run]	[direction / distribution; missing n]
Recorded sex	Male=1, female=0	[not run]	[direction / distribution; missing n]
Treatment	Combined=1, ACXL alone=0	[not run]	[direction / distribution; missing n]
Kmax	Per 1 D	[not run]	[direction / distribution; missing n]
TCT	Per 1 micrometre	[not run]	[direction / distribution; missing n]
